

VoltVibe Certified Refurbished Quality Grading and Diagnostic Standards

1. The Refurbishing & Diagnostic Process Flow

Every pre-owned or customer-returned device received at VoltVibe's centralized processing facilities undergoes a rigorous, multi-stage diagnostic testing flow prior to grading. Devices are initially cleaned, sanitized, and subjected to physical inspection. Once basic telemetry is established, the device is connected to our proprietary hardware diagnostics bench (VibeScan Utility v4.1) for an automated 30-point functionality evaluation. This evaluation verifies logical circuit integrity, baseband connectivity, multi-band Wi-Fi/Bluetooth signal attenuation, ambient light sensors, gyroscope calibration, display digitizer responsiveness, speaker resonance, and microphone distortion. Devices that fail any core operational tests are routed directly to the repair queue, where genuine OEM replacement modules are installed by certified technicians before the device is allowed to re-enter the grading queue. All refurbished devices are guaranteed to have 100% functional equivalence to brand-new units, regardless of their final cosmetic classification.

2. Detailed Quality Grading Criteria Matrix

Refurbished devices are classified into three distinct tiers: Grade A (Like-New), Grade B (Light Wear), and Grade C (Value Grade). Classification is based on physical cosmetic imperfections and current battery health metrics, as summarized in the quality matrix table below:

Quality Grade	Cosmetic Condition	Battery Capacity	Packaging & Accessories
Grade A (Like-New)	Zero visible scratches or scuffs on screen/casing/bezel. Screen is pristine.	95% or higher	Original retail box (or VoltVibe white box) with OEM charger and cable.
Grade B (Light Wear)	Minor hairline scratches on casing/bezel. No screen damage.	85% to 94%	Generic brown box with compatible third-party charger and cable.
Grade C (Value Grade)	Visible cosmetic wear, small dents on casing/bezel, or minor scuffs.	80% to 84%	Generic brown box. Device only, charger and cable sold separately.

2.1 Cosmetic Inspection Specifications

Cosmetic inspections are performed under 1200-lumen overhead lighting panels by certified QA inspectors. For Grade A classification, the device must exhibit zero blemishes when viewed from a distance of 8 inches (20 cm). Grade B allows for up to three hairline scratches on the back casing or frame, provided they are less than 0.5 mm in depth and under 10 mm in length; no scratches of any size are permitted on the display screen itself. Grade C allows for up to five visible scuffs or scuffed corners, frame paint chips, and minor hairline scratches on the display assembly, provided they are not deep enough to cause refraction of the backlight or touch-input dead zones.

3. Power Modules, Battery Diagnostics, and Calibration

Lithium-ion battery performance is a critical indicator of device longevity. Every refurbished device undergoes a full charge-discharge cycle test to calculate the remaining maximum chemical capacity relative to its design capacity. The

minimum battery health threshold for any refurbished device to be cleared for sale is 80%. Devices that register below 80% maximum capacity are rejected during initial sorting and routed to the battery replacement queue, where a brand-new OEM battery pack is installed.

3.1 Replaced Battery Module Grading Inconsistency

AMBIGUOUS GRADING EXCLUSION: Devices that undergo complete battery module replacements are subject to unique grading rules. Although a replaced battery has a chemical health metric of 100%, the overall device cannot be graded as Grade A (Like-New) regardless of how pristine the cosmetic casing is. All battery-replaced devices are strictly limited to Grade B or Grade C classification. This policy is in place to account for minor tool marks or seal modifications introduced during the disassembly and replacement process. Conversely, if a device is graded as Grade A, it is guaranteed to contain its original factory battery with a health score of 95% or higher, ensuring the device's water-resistance seals remain completely unbroken since the original factory assembly.

3.2 Cycle Count Logging and Calibration Loops

Battery diagnostics include reading the device's internal power management cycle count log. To guarantee reading accuracy, the device must complete a mandatory 12-hour calibration loop: charged to 100%, held at maximum voltage for 2 hours, discharged to 0% via a CPU-intensive loop, and then recharged back to 100%. This calibration resets the device's internal state-of-charge estimator, preventing sudden battery drops or irregular readings reported by end-users. The final battery health score is recorded in the device's firmware and printed on the QA pass certificate.

4. Packaging, Accessories, and Serialization

The classification of a refurbished device directly dictates the packaging presentation and accessories included in the shipment. VoltVibe enforces strict serialization tracking for all refurbished units to prevent inventory shrinkage and fraudulent returns.

4.1 Serialization & Refurbished Tracking

Upon passing final diagnostic inspection, the device's original IMEI or serial number is permanently linked to a unique VoltVibe Refurbished Identifier (VRID) formatted with the prefix `VV-RFB-` followed by an 8-digit alphanumeric code. This VRID is laser-etched onto the shipping label and recorded in the customer's account order details. All warranty claims, return processing, or trade-in inquiries require validation of this VRID. Any return package where the device's internal serial number does not match the registered VRID will be rejected and returned to sender.

4.2 Accessory Pack Inclusions and Exclusions

Grade A devices include a brand-new official OEM charger block and a certified charging cable (packaged inside a VoltVibe white retail box). Grade B devices include high-quality, UL-certified third-party charging accessories packaged in a generic brown cardboard box. Grade C devices do not include any accessories, charging blocks, or cables; they are shipped as 'device-only' units inside bubble-wrap protective bags. This accessory exclusion allows Grade C items to be sold at a significant discount. Accessories can be purchased separately at a 15% discount when ordered alongside a Grade C device, as detailed in our accessory product catalogue.

5. Refurbished Warranty Coverage and Return Policy

All VoltVibe Certified Refurbished devices include a 90-day limited manufacturer warranty. This coverage begins on the date of delivery and is restricted to hardware defects in materials and workmanship under standard consumer use conditions.

5.1 Scope of the 90-Day Limited Warranty

The refurbished warranty covers mechanical and electrical component failures, such as touchscreen failure, malfunctioning ports, defective logical boards, or failing speaker elements. The warranty does **not** cover: cosmetic wear occurring after delivery, liquid damage (regardless of original factory rating, since seals degrade over time), accidental drop damage, or software modifications. Furthermore, battery degradation is excluded from warranty coverage: if a device's battery capacity drops below 80% **after** the purchase date, this is considered standard physical wear-and-tear unless the drop occurs within the first 14 calendar days of delivery, in which case it is treated as a defect present at the time of grading.

5.2 Returns, Restocking Fees, and Active Lock Exclusions

Customers may return Grade A or Grade B refurbished devices within 30 days of delivery, subject to a 10% restocking fee (calculated on the final purchase price, excluding taxes and shipping, in accordance with [doc_06_restocking_fees.pdf](#)). Grade C devices, promotional items, and outlet clearance units are considered final sale and cannot be returned for refund or credit, except where statutory protections apply (such as in California, Oregon, and the EEA). **CRITICAL CRITERIA:** Any returned refurbished device must have all security accounts removed and be factory reset. If a device is returned with an active security lock (such as Apple iCloud Activation Lock, Samsung SmartLock, or Google Device Protection), the return will be rejected. The customer will be notified via email and must remove the lock remotely via their cloud portal. If the lock is not removed within 5 business days of notification, the device will be returned to the customer at their expense, and they will be charged a \$45 administrative security bypass processing fee.

5.3 Regional Warranty Exceptions & Legal Rights

The terms outlined in this policy do not restrict or replace statutory consumer protection guarantees. Specifically, customers residing in the State of California are entitled to an implied warranty of merchantability for refurbished goods extending up to 1 year, and may request repair or replacement at authorized regional service hubs. EEA residents are covered by statutory guarantees matching local country laws. Customers must provide proof of primary residence to activate regional policy overrides.
