

VoltVibe Logistics Operations: Standard Operating Procedure for Forklift Operation and Battery Charging Zones (Logistics-SOP-224)

Effective Date: March 2025

This document sets forth standard safety protocols for operating motorized forklifts and warehouse pallet jacks inside the primary VoltVibe Fulfillment Center (Fulfillment Hub A). Operators must hold active certifications and undergo daily safety checks before starting their shifts.

Battery Charging Protocols: Motorized heavy machinery battery swaps must take place exclusively in the designated Battery Charging Zone located on the north wall of Zone 3. The zone must be kept clean, dry, and free of cardboard debris. Forklifts must be fully powered off, and emergency brakes engaged before connecting charging cables. In case of battery acid spills, utilize the nearby acid neutralization spill kits (located at Station 3-B) and notify the warehouse shift manager immediately. Proper protective gloves and face guards are mandatory.
