

VoltVibe Tech Team: Engineering Standard - Git Branching and Pull Request Workflows

Revision: Version 3.4 (January 2026)

This technical guide establishes Git branching strategies for VoltVibe's software development teams working on the online storefront and internal inventory APIs.

Branching Conventions:

- Main Branch: The main branch contains production-ready code. Commits are prohibited directly to main.
- Develop Branch: The develop branch is the primary integration branch for active development.
- Feature Branches: Developers must create isolated branches prefixed with feature/ (e.g., feature/cart-checkout-api) branched from develop for all task tickets.
- Pull Requests (PRs): PRs must have at least two peer reviews and pass automated CI tests (linting, pytest, security scanning) before merging into develop.
